EXPLANATORY NOTES

INTRODUCTION

In 1985, the OECD published a set of Purchasing Power Parities (PPPs) for 18 Member countries based on price and expenditure data for 1980. The PPPs were calculated jointly by the OECD and the Statistical Office of the European Communities (EUROSTAT). A new set of PPPs is now available for 22 OECD countries based on price and expenditure data for 1985. As before, the PPPs were calculated in collaboration with EUROSTAT. This report presents the new benchmark PPPs and the associated estimates of real expenditure on GDP for 1985.

Provisional summary results for 1985 have been published already in a special supplement to the 1987 edition of *National Accounts, Volume 1*. The results in this report, however, are final and more detailed: two expenditure classifications, each having some 55 expenditure categories, are used in their presentation. The presentation of results, the collection of price and expenditure data, and the calculation of PPPs and real expenditures are explained briefly in the text below.

PPPS AND EXCHANGE RATES: REAL AND NOMINAL VALUES

Purchasing Power Parities are the rates of currency conversion that equalise the purchasing power of different currencies. This means that a given sum of money, when converted into different currencies at the PPP rates, will buy the same basket of goods and services in all countries. In other words, PPPs are the rates of currency conversion which eliminate the differences in price levels between countries. Thus, when expenditures on the GDP for different countries are converted into a common currency by means of PPPs, they are in effect expressed at the same set of international prices so that comparisons between countries reflect only differences in the volume of goods and services purchased.

Exchange rate converted expenditures, on the other hand, reflect not only differences in the quantities purchased in the different countries, but also the differences in price levels between the countries. Exchange rates do not reflect the relative purchasing powers of different currencies and are not, therefore, the appropriate currency conversion rates with which to make international comparisons of volume. Expenditures on GDP converted at exchange rates remain essentially *nominal* measures; the same expenditures converted using PPPs are *real* measures.

NOTES EXPLICATIVES

INTRODUCTION

En 1985, l'OCDE a publié un ensemble de Parités de Pouvoir d'Achat (PPA) pour 18 pays Membres, établi à partir de séries de prix et de dépenses pour l'année 1980. Les PPA ont été calculées conjointement par l'OCDE et l'Office Statistique des Communautés Européennes (EUROSTAT). Un nouvel ensemble de PPA est maintenant disponible pour 22 pays de l'OCDE, établi sur la base de séries de prix et de dépenses de 1985. Comme précédemment, les PPA ont été calculées en collaboration avec EUROSTAT. Ce rapport présente la nouvelle étude portant sur les PPA et les estimations des dépenses réelles imputées au PIB de l'année 1985.

Des résultats provisoires pour 1985 ont déjà fait l'objet d'une publication spécifiquement consacrée aux PPA, sous la forme d'un supplément à l'édition 1987 des *Comptes Nationaux, Volume 1*. Cette étude présente cependant des résultats finalisés plus détaillés : deux classifications des dépenses, comportant chacune quelques 55 catégories, sont utilisées ici. Les tableaux de résultats, la collecte des données de prix et de dépenses ainsi que le mode de calcul des PPA et des séries de dépenses réelles font l'objet d'une brève explication dans ce qui suit.

PPA ET TAUX DE CHANGE : VALEURS RÉELLES ET NOMINALES

Les Parités de Pouvoir d'Achat sont des taux de conversion monétaire qui permettent d'exprimer des égalités entre les pouvoirs d'achat des différentes monnaies. Autrement dit, une somme d'argent donnée, convertie en monnaies nationales au moyen des PPA, permettra d'acheter le même panier de biens et de services dans tous les pays. Les PPA sont donc des taux de conversion monétaire qui éliminent les différences de niveaux de prix existant entre les pays. Ainsi, les dépenses imputées au PIB, pour les différents pays, converties en une unité commune en utilisant les PPA, sont de ce fait, exprimées en fonction d'une même structure de prix internationaux si bien que les écarts entre les pays reflètent uniquement les différences de volume de biens et services achetés.

Les dépenses converties au moyen des taux de change reflètent, par contre, non seulement les écarts entre les quantités achetées mais également les différences de niveaux de prix existant entre les différents pays. Les taux de change ne reflètent pas les pouvoirs d'achat relatifs des différentes monnaies et ne constituent pas des taux de conversion monétaire appropriés à des comparaisons internationales de volume. Les dépenses imputées au PIB converties au moyen des taux de change sont fondamentalement des mesures *nominales* ; ces mêmes dépenses converties au moyen des PPA constituent des mesures *réelles*.

Both real expenditures and nominal expenditures are available in this report. The real values are given in US dollars; the nominal values are given in national currencies and also in US dollars. The choice of the US dollar as the common unit of currency is purely a matter of convention which has no effect on the comparison between countries.

The benchmark PPPs given in this report have been calculated specifically for statistical purposes in order to enable international price and volume comparisons to be made for GDP and its components. Although PPPs also appear in the context of international trade theory, the PPPs shown here may not be particularly relevant for this purpose because they do not refer solely to goods that are traded internationally. Instead, they refer to the entire range of *final* goods and services which make up GDP as a whole including many items, such as construction and government services, which are not traded internationally.

ICP AND SNA CLASSIFICATIONS

The PPPs, the real and nominal expenditures, and the associated price and volume indices for 1985 are presented in two ways in the report. The first presentation follows the expenditure classification of the *United Nations International Comparison Project* (ICP); the second follows the expenditure classification of the *United Nations System of National Accounts* (SNA).

The essential difference between the two classifications is that the ICP classifies consumption expenditures by reference to consumption while the SNA classifies them by reference to expenditure. Thus, in the ICP classification, expenditures by government on health, education, social security and welfare services, and recreational and cultural services – which are actually consumed by individual households – are removed from Government Final Consumption Expenditure and reallocated to Private Final Consumption Expenditure to obtain *Individual Consumption by Households*. The remaining expenditure by government, namely those on general public services, defence, housing, community and economic services – from which households benefit collectively – are termed *Collective Consumption by Government*.

The division of government expenditure between collectively-consumed services and individually-consumed services is necessary because of the various ways the latter, particularly health and education, are financed in Member countries. When the SNA classification is used, households in countries where government directly provides health and education will appear to consume a smaller volume of goods and services than households in countries where households themselves pay directly for these services. Hence, the ICP aggregate, *Individual Consumption by Households*, is a better comparative measure of the actual volume of goods and

Les deux types de mesures, réelles et nominales, sont présentées dans ce rapport. Les valeurs réelles sont exprimées en dollars des E.U., les valeurs nominales sont exprimées en monnaies nationales et en dollars des E.U.. Le choix du dollar des E.U. comme unité monétaire est uniquement une convention qui n'affecte en aucune façon les comparaisons entre pays.

Les PPA faisant l'objet de cette étude ont été calculées dans un but statistique spécifique : permettre des comparaisons internationales de prix et de volume du PIB et de ses composantes. Bien que l'approche théorique du commerce international fasse référence aux Parités de Pouvoir d'Achat, les PPA publiées ici ne relèvent probablement pas de cette approche car elles ne se réfèrent pas uniquement aux biens faisant l'objet d'échanges internationaux. Elles recouvrent l'ensemble des biens et des services *finaux* qui constituent le PIB, dont un certain nombre, comme la construction et les services du gouvernement, ne sont pas échangés sur le marché international.

CLASSIFICATIONS PCI ET SCN

Les PPA, les dépenses réelles et nominales ainsi que les indices de prix et de volume associés pour 1985 sont présentés dans ce rapport sous deux formes, la première étant la classification des dépenses du *Projet de Comparaison Internationale des Nations Unies* (PCI), la seconde, celle du *Système de Comptabilité Nationale des Nations Unies* (SCN).

La différence essentielle entre ces deux classifications est la suivante : le PCI définit les dépenses de consommation par référence au concept de consommation alors que le SCN les définit par référence au concept de dépense. Ainsi, les dépenses du gouvernement concernant la santé, l'enseignement, la sécurité sociale et œuvres sociales, les loisirs et la culture, qui font en fait l'objet d'une consommation de la part des ménages, sont, selon la classification du PCI, traitées non comme faisant partie de la consommation finale des administrations publiques mais ajoutées à la consommation finale privée qui devient alors la *Consommation individuelle des ménages*. Les autres dépenses du gouvernement portant sur les services généraux, la défense nationale, les logements, le développement collectif et les services économiques – dépenses dont les ménages bénéficient de façon collective – sont classées sous la rubrique *Consommation collective des administrations publiques*.

La distinction entre les services consommés de façon collective et les services consommés à un niveau individuel est nécessaire car le financement de ces derniers, en particulier de ceux concernant la santé et l'enseignement, varie selon les pays Membres. Quand on applique la classification du SCN, la consommation des ménages des pays où le gouvernement fournit directement les services de santé et d'enseignement, semble être plus faible que celle des ménages des pays où ces services sont payés par les ménages eux-mêmes. De ce fait, l'agrégat *Consommation individuelle des ménages*, selon le PCI, est une meilleure mesure pour la

services consumed by households of different countries. Conversely, Government Final Consumption Expenditure (SNA) is better than Collective Consumption of Government (ICP) as a measure of the total volume of services financed by government.

EEC PRICES, OECD PRICES, INTERNATIONAL PRICES

Twenty-two OECD countries are covered in the report; only two Member countries, Iceland and Switzerland, are not included. Twelve of the 22 countries are also members of the European Economic Community (EEC). The results for these countries are the responsibility of EUROSTAT.

EUROSTAT calculated the results for the twelve Community countries at *average EEC prices* (that is, the average prices of the twelve). These are official results within the Community on which a number of Community policy decisions are based. EUROSTAT and the Community countries have therefore decided that these official Community results must be preserved in any comparison embracing a wider group of countries. In order to achieve this within the OECD comparison, the Community is treated as a single entity. Real values for the individual Community countries remain at average EEC prices; only real values for the Community as a whole and the non-Community countries are shown at *average OECD prices* (that is, the average prices of the 22 countries).

Comparisons between Community and non-Community countries have to be effected by linking the Community totals at average EEC prices with the Community totals at average OECD prices. The PPPs, the volume indices and the comparative dollar price level indices have been obtained in this manner. These linked series are described in the tables as being at *international prices* so as to indicate their comparability across all 22 countries.

Linked data, however, are not additively consistent: that is, linked components do not sum to linked totals. Consequently, the percentage distributions of real values and the relative price level indices do not utilise the linked data and are based on average EEC prices in the case of Community countries and on average OECD prices in the case of non-Community countries.

DATA COLLECTION

The PPPs were derived using price and expenditure data relating to the year 1985. EUROSTAT coordinated the data collection for the twelve Community

comparaison du volume de biens et services consommés par les ménages dans les différents pays. Inversement, la rubrique Consommation finale des administrations publiques (SCN) est plus représentative que la Consommation collective des administrations publiques (PCI) du volume total des services financés par le gouvernement.

PRIX CEE, PRIX OCDE, PRIX INTERNATIONAUX

Ce rapport traite de 22 pays Membres de l'OCDE. Deux pays seulement, l'Islande et la Suisse, n'ont pas été pris en compte. Douze de ces 22 pays sont également membres de la Communauté Economique Européenne (CEE). EUROSTAT a effectué l'étude et produit les résultats pour ces pays.

EUROSTAT a calculé les résultats pour les douze pays de la Communauté *aux prix moyens de la CEE* (c'est-à-dire, aux prix moyens des douze pays). Ces résultats constituent les données officielles sur lesquelles se fondent un certain nombre de décisions politiques communautaires. EUROSTAT et les pays de la Communauté ont donc décidé que ces chiffres officiels ne doivent pas être modifiés lorsqu'on les intègre dans une comparaison portant sur un groupe élargi de pays. Afin de respecter ce principe, la Communauté a été traitée comme une entité unique dans les résultats de l'OCDE. Les valeurs réelles pour chacun des pays de la Communauté demeurent aux prix moyens de la CEE et seules les valeurs pour la Communauté, considérée comme un pays, et celles des pays non-membres de la Communauté sont exprimées *aux prix moyens de l'OCDE* (c'est-à-dire aux prix moyens des 22 pays).

Les comparaisons entre les pays appartenant à la Communauté et les autres doivent donc être faites au moyen d'un raccordement entre les données pour le total Communauté aux prix moyens de la CEE et les données pour le total Communauté aux prix moyens de l'OCDE. C'est de cette façon qu'ont été calculés les PPA, les indices de volume et les indices de niveaux de prix comparés du dollar. Les séries ainsi construites sont exprimées *aux prix internationaux* pour bien indiquer qu'elles sont comparables pour les 22 pays.

Cependant, les données ainsi raccordées ne s'additionnent pas exactement : la somme des composantes raccordées n'est pas égale au total obtenu par raccordement. Pour cette raison, les pourcentages de distribution des valeurs réelles et les indices de prix relatifs n'ont pas été calculés à partir des données raccordées mais à partir des chiffres aux prix moyens de la CEE pour les pays de la Communauté et des chiffres aux prix moyens de l'OCDE pour les autres pays.

COLLECTE DES DONNÉES

Les PPA ont été calculées à partir de données de prix et de dépenses de l'année 1985. EUROSTAT a coordonné les collectes de données dans les douze pays

countries and Austria; the OECD co-ordinated the data collection for the remaining nine non-Community countries. The OECD was also responsible for combining the two sets of data in order to obtain results for the 22 OECD countries, but the actual calculations, both for the twelve and for the larger OECD group, were carried out by EUROSTAT.

The calculation of benchmark PPPs requires from each participating country a set of average national annual prices and a breakdown of national expenditure. The prices are used to derive "price relatives" for individual goods and services which are then averaged to obtain unweighted "parities" for small groups of goods and services. These unweighted parities are subsequently combined using the breakdowns of national expenditures to derive weighted PPPs at various levels of aggregation cumulating in the overall PPPs for GDP.

Unweighted parities are calculated at the level of the "basic heading". In principle, a basic heading consists of a group of similar well-defined commodities for which a sample of products can be selected that are representative both of their category and of the participating countries. In practice, a basic heading is defined by the lowest level of expenditure category for which explicit expenditure weights can be estimated.

For 1985, the expenditure breakdown for the Community countries consisted of 258 basic headings, whereas the breakdown for the non-Community countries was not as fine with only 202 basic headings. The difference between the two breakdowns was confined to Private Final Consumption Expenditure. The Community countries had 216 basic headings and the non-Community countries 160 to which the Community headings aggregated exactly. Otherwise, the breakdowns were the same with 9 basic headings for Government Final Consumption Expenditure and 30 for Gross Fixed Capital Formation (9 for construction and civil engineering, 21 for machinery and equipment). Increase in Stocks and Balance of Exports and Imports were treated as two basic headings and not broken down further.

Products are selected to represent each basic heading. Care is taken to ensure that the items selected are commonly found in each of the participating countries. Items are precisely defined to ensure that countries price and compare equivalent items.

For each basic heading, each participating country must nominate and define at least one product that is purchased sufficiently frequently for it to be representative of the expenditure by that country on the basic heading. To be included in the final selection, however, each product nominated must also be accepted by at

de la Communauté ainsi qu'en Autriche. L'OCDE s'est chargée de la collecte des données pour les autres neuf pays non-membres de la Communauté. L'OCDE a également eu la responsabilité de traiter les deux ensembles de données afin d'obtenir les résultats pour le groupe des 22 pays Membres mais les calculs proprement dits, tant pour les douze que pour le groupe OCDE, ont été effectués par EUROSTAT.

Le calcul des PPA de référence implique que pour tous les pays couverts par l'étude un ensemble de prix moyens nationaux ainsi qu'une ventilation de la dépense nationale soient fournis. Les prix sont utilisés pour calculer des « prix relatifs » pour chaque rubrique de biens et services, prix relatifs ensuite utilisés pour calculer des « parités » non pondérées pour de petits groupes de biens et services. Ces parités non pondérées sont ensuite utilisées ainsi que les agrégats de la dépense nationale dans le calcul des PPA pondérées, aux différents niveaux d'agrégation jusqu'au niveau d'agrégation maximum : la PPA du PIB.

Les PPA non pondérées sont calculées pour les « rubriques élémentaires ». Une rubrique élémentaire correspond, en principe, à un groupe de produits similaires, clairement définis, pour lesquels un échantillon peut être sélectionné, qui sont à la fois représentatifs de la rubrique et des comportements dans les pays concernés. En pratique, la rubrique élémentaire est définie au niveau le plus désagrégé de la catégorie de dépense pour lequel des pondérations explicites peuvent être estimées.

Pour l'étude 1985, la dépense a été ventilée en 258 rubriques élémentaires pour les pays de la Communauté. Une ventilation moins fine, 202 rubriques élémentaires, a été adoptée pour les pays non-membres de la Communauté. Cette différence entre les ventilations concerne uniquement la Consommation finale privée. Les pays de la Communauté avaient 216 rubriques élémentaires, les autres pays, 160, qui recouvraient, au total, exactement le même ensemble de produits. Pour les autres agrégats, la ventilation est identique avec 9 rubriques élémentaires pour la Dépense finale des administrations publiques et 30 rubriques élémentaires pour la Formation brute de capital fixe (9 pour la construction et les ouvrages de génie civil, 21 pour les machines et matériel d'équipement). Les variations de stocks et le solde des exportations et des importations ont été traités comme des rubriques élémentaires et n'ont pas fait l'objet de ventilation détaillée.

Les produits composant la rubrique élémentaire sont sélectionnés avec soin et en s'assurant qu'ils sont couramment disponibles dans tous les pays concernés. Les articles sont définis avec une précision suffisante pour que les pays puissent fournir des prix pour des articles comparables.

Pour chaque rubrique élémentaire, les pays doivent sélectionner et définir au moins un produit qui soit consommé de façon fréquente et qui soit représentatif, pour la rubrique, du pays en question. Cependant, pour être retenu dans la sélection finale, chaque produit ainsi sélectionné doit être approuvé par au moins un autre

least one other participating country and preferably by a country where the product, if not representative, is at least sold in large enough quantities for the price not to be untypical.

For Community countries, product lists were available from the previous benchmark price surveys for 1980. These lists were updated by EUROSTAT, after consultations with the Community countries, for the 1985 price surveys. No such product lists existed for the non-Community countries and, as for 1980, the EUROSTAT lists had to be used. This time, however, these lists were enlarged by the OECD to include products that were representative of non-Community countries for those basic headings where it appeared to be necessary.

The final product lists for the 1985 price surveys covered some 2500 consumer goods and services, 30 occupations in government, education and health services, 250 types of machinery and equipment, and 18 building and construction projects. These last were defined in bills of quantities that specify in detail the material and factor inputs.

Not all the products listed were available in all countries so not every product was priced by every participating country. In a multilateral comparison, however, it is not necessary for a country to price all items because it is not necessary to calculate a direct binary parity for each pair of countries. A country need only price the most representative items (that is, its own products) and a share of the less representative items (that is, the products of other countries) for parities to be calculated, either directly or indirectly, between pairs of countries.

Consumer goods and services were priced in the Community countries between Autumn 1984 and Spring 1986. There were five surveys in all: one in 1984, three in 1985 and one in 1986. Clothing and footwear, furniture and furnishings were covered in 1984; food, beverages and tobacco in 1986. Other consumer goods and services – such as household appliances, personal transport equipment, goods for personal care and household operation, fuel and power, repair and maintenance services, and transport services – were covered in 1985. Rents, insurances and medical goods and services, however, were not covered in these price surveys. Instead they were subjects of special enquires undertaken in mid-1986.

The organisation of the price surveys for consumer items was the responsibility of the national statistical services in the Community countries. The surveys were carried out in the capital cities. After each survey the individual price quotations collected were sent to EUROSTAT where they were converted to average prices. These average prices, which referred to the

pays et de préférence, par un pays où il est vendu en quantité suffisante pour que son prix ne soit pas atypique.

Des listes de produits, établies pour les enquêtes de prix relatives à la précédente étude de 1980, étaient disponibles pour les pays de la Communauté. Ces listes ont été mises à jour par EUROSTAT, après consultation avec les pays de la Communauté, pour l'étude 1985. De telles listes n'existaient pas pour les pays non-membres de la Communauté et ce sont les listes d'EUROSTAT qui ont été utilisées pour l'étude de 1980. Pour l'étude 1985, cependant, ces listes ont été élargies par l'OCDE de façon à inclure des produits représentatifs des pays non-membres de la Communauté dans les rubriques élémentaires quand cela s'est avéré nécessaire.

Les listes de produits finalisées pour les enquêtes de prix 1985 couvrent quelques 2 500 biens et services pour la consommation, 30 activités pour les administrations publiques et les services de santé et d'enseignement, 250 catégories de machines et matériel d'équipement et enfin 18 types d'immeubles et constructions ; ces derniers ont été définis sur la base de devis quantitatifs spécifiant de façon détaillée les matériaux et les autres composantes nécessaires.

Tous les produits figurant sur ces listes ne sont pas disponibles dans tous les pays si bien qu'il ne leur a pas forcément été affecté un prix par tous les pays. Il n'est d'ailleurs pas indispensable, quand on procède à une comparaison multilatérale, que des prix soient affectés à tous les articles puisqu'on ne calcule pas de parité bilatérale directe pour chaque paire de pays. Il suffit que chaque pays fournisse un prix pour les articles les plus représentatifs (en fait, ceux produits par lui) et pour quelques-uns des autres (produits par les autres pays) pour qu'il soit possible de calculer les parités pour chaque paire de pays, directement ou indirectement.

Les prix des biens et services de consommation ont été établis, pour les pays de la Communauté, de l'automne 1984 au printemps 1986. Cinq enquêtes ont eu lieu au total : une en 1984, trois en 1985 et la dernière en 1986. En 1984, l'enquête couvre les articles d'habillement et chaussures et les meubles et articles d'ameublement ; en 1986, elle couvre les produits alimentaires, boissons et tabac. Les autres biens et services : matériel et articles de ménage, achats de véhicules, soins personnels, entretien courant de la maison, chauffage et éclairage, services de réparation et d'entretien divers et services de transports ont été couverts par les études de 1985. Les loyers, les assurances et les médicaments et autres produits pharmaceutiques n'ont pas été pris en compte lors de ces enquêtes et ont fait l'objet d'enquêtes spécifiques mi-1986.

Les services statistiques nationaux des pays de la Communauté étaient responsables de l'organisation des enquêtes de prix pour les biens et services de consommation. Les enquêtes ont été menées dans les capitales. Après chaque enquête, les relevés de prix nationaux ont été envoyés à EUROSTAT qui a établi les prix moyens. Ces prix moyens, relatifs aux capitales et

capital cities at the time of the surveys, were subsequently adjusted by EUROSTAT to national prices for 1985 using regional price indices to make them national and temporal price indices to centre them on 1985.

The collection of prices for Gross Fixed Capital Formation was undertaken for EUROSTAT by independent experts appointed by the Community countries. Prices provided for machinery and equipment were mid-year prices for 1985. Similarly, for construction and civil engineering, the unit prices provided for the components detailed in the bills of quantities were mid-1985 prices.

Non-Community countries did not have the same resources available to them as the Community countries where the data collection was largely financed by EUROSTAT. Consequently, the national statistical services of the non-Community countries made every effort to utilise the price data they had collected for their various price indices relating to consumer goods and services, investment goods, and construction and civil engineering.

This approach was particularly successful in the United States for consumer items and, to a lesser extent, for machinery and equipment. For the other non-Community countries some additional price collection proved to be unavoidable. The additional pricing was undertaken by the national statistical services. In Canada, however, the pricing of machinery and equipment was contracted out to private consultants.

Except in Canada and Norway, pricing the construction and civil engineering projects was a problem for the national statistical services of the non-Community countries. Usually, the bills of quantities were completed by another government or quasi-government agency, although in the United States the pricing was done by a private consultancy firm.

In most instances the prices reported to the OECD by the non-Community countries were average national mid-year prices for 1985. Turkey, however, supplied average national annual prices for 1985.

Compensation of employees working in selected occupations in government, health and education services was obtained by questionnaire from both Community and non-Community countries. The annual compensation in 1985 for each occupation was reported. This included, in addition to gross salary, employer's contributions to social security, pension and similar schemes. When such schemes were unfunded, the employer's contributions were imputed in line with the national accounting practices followed by the country.

Expenditure data were also collected by questionnaire. Countries provided a detailed breakdown of national expenditure by basic heading for the latest year available. In some cases this was 1985, but usually it was 1984 or even 1983. This breakdown was then

au moment précis de l'enquête, ont ensuite été ajustés par EUROSTAT. Des indices de prix régionaux et des indices de prix temporels ont été utilisés pour obtenir des prix moyens nationaux centrés sur 1985.

La collecte des prix pour la Formation brute de capital fixe a été faite pour EUROSTAT par des experts indépendants, choisis par les pays de la Communauté. Pour les machines et le matériel d'équipement les prix fournis sont des prix en milieu d'année 1985. De même, les prix unitaires fournis pour les composantes détaillées des devis relatifs aux immeubles et construction sont des prix en milieu d'année 1985.

Dans les pays de la Communauté les enquêtes ont été largement financées par EUROSTAT. Les pays non-membres ne disposaient pas des mêmes ressources. Les services statistiques nationaux ont donc largement puisé dans les relevés de prix qu'ils collectent pour établir leurs divers indices de prix, indices des biens et services de consommation, des biens d'investissement ainsi que de la construction et ouvrages de génie civil.

Cette approche a abouti, aux Etats-Unis, à des résultats particulièrement satisfaisants en ce qui concerne les articles de consommation, et à des résultats plus moyens pour ce qui est des machines et du matériel d'équipement. Dans les autres pays non-membres de la Communauté des enquêtes de prix additionnelles ont été inévitables. Elles ont été menées par les services statistiques nationaux. Au Canada, cependant, l'établissement des prix des machines et matériel d'équipement a été confié à des consultants du secteur privé.

L'établissement de prix pour la construction et ouvrages de génie civil a posé un problème aux services statistiques des pays non-membres de la Communauté à l'exception du Canada et de la Norvège. De façon générale, les devis quantitatifs ont été établis par un autre organisme public ou semi-public et, aux Etats-Unis, par une société privée.

Dans la plupart des cas, les prix transmis à l'OCDE par les pays non-membres de la Communauté étaient des prix moyens nationaux en milieu d'année 1985, à l'exception de la Turquie qui a envoyé des prix moyens nationaux pour 1985.

Les rémunérations des salariés des professions sélectionnées pour le gouvernement et les services de santé et d'enseignement ont fait l'objet d'un questionnaire, soumis aux pays membres et non-membres de la Communauté, portant sur les rémunérations annuelles en 1985 pour chaque activité. Ces rémunérations recouvrent le salaire brut, les contributions des employeurs à la sécurité sociale, aux régimes de pension et autres régimes similaires. Dans le cas où il s'agit de cotisations sociales imputées, les contributions des employeurs ont été estimées conformément à la pratique du pays en matière de comptabilité nationale.

Les données de dépenses ont également été collectées par questionnaire. Les pays ont fourni une ventilation de la dépense nationale détaillée par rubrique élémentaire pour la dernière année disponible. Dans certains cas c'était l'année 1985, mais de façon géné-

applied to the latest estimates for GDP and the main expenditure categories available for 1985 at the time of calculation.

CALCULATION OF THE PPPS

The calculation of PPPs is undertaken in two stages. First, there is the estimation of parities at the basic heading level; then, there is the aggregation of the basic heading parities and real values upto the level of GDP. In the calculations for 1985, the Eltelo-Köves-Szulc (EKS) method was used to obtain the parities for the basic headings and the Geary-Khamis method was used to aggregate the basic heading parities and real values.

The expenditure breakdown followed by the Community countries had a larger number of basic headings than that of the non-Community countries. This was of no significance to the EUROSTAT comparison, but it was of relevance to the OECD comparison involving both Community and non-Community countries. However, since the Community basic headings were just a further disaggregation of those of the non-Community countries, the problem was overcome in the following way.

First, the EKS was applied at the basic heading level of the non-Community countries using all the prices available for the 22 countries to obtain a matrix of parities comprising both groups of countries. The EKS was then applied at the basic heading level of the Community countries to obtain a matrix of parities for the Community countries alone. These parities were aggregated up to the less detailed basic heading level of the non-Community countries by means of the Geary-Khamis method and linked with those for the non-Community countries contained in the first matrix. Hence, a new matrix of parities for the 22 countries was derived which, unlike the original matrix, was calculated using the more detailed expenditure data available for Community countries.

To complete the aggregation, the Geary-Khamis method was applied twice. Once to the parities of the Community countries to obtain PPPs and real values at average EEC prices, and once to the parities of the 22 countries to obtain PPPs and real values for the Community as a whole and the non-Community countries. Since the GDP for the Community as a whole at the average EEC prices was at a different level to that calculated at average OECD prices, the former was set equal to the latter and the matrix of real values for the Community multiplied through by the resulting scalar. Accordingly, GDP is directly comparable across all 22 countries, but its components are not and have to be

rale, c'était 1984 et même 1983. Cette ventilation a ensuite été utilisée pour désagréger les données plus récentes du PIB et des principales composantes de la consommation, disponibles pour 1985 au moment des calculs.

CALCUL DES PPA

Le calcul des PPA se fait en deux étapes. On calcule d'abord les parités au niveau des rubriques élémentaires puis, dans un deuxième temps, on agrège les parités des rubriques élémentaires et les valeurs réelles jusqu'au PIB. Pour l'exercice 1985, la méthode Eltelo-Köves-Szulc (EKS) a été utilisée pour calculer les parités des rubriques élémentaires et la méthode Geary-Khamis pour agréger ces parités et les valeurs réelles.

La ventilation des dépenses utilisée par les pays membres de la Communauté comportait un plus grand nombre de rubriques élémentaires que celle utilisée par les pays non-membres. Cette différence n'a pas affecté la comparaison effectuée par EUROSTAT, par contre, elle a constitué un problème quand l'OCDE a procédé à la comparaison des pays membres et non-membres de la Communauté. Cependant, les rubriques élémentaires de la Communauté étant simplement plus détaillées que celles des pays non-membres, le problème a été résolu de la façon suivante.

Tout d'abord, la méthode EKS a été appliquée au niveau de détail des rubriques élémentaires des pays non-membres de la Communauté, en utilisant toutes les données de prix disponibles pour les 22 pays. Une matrice de parités comprenant les deux groupes de pays a été ainsi construite. Puis la méthode EKS a été appliquée au niveau des rubriques élémentaires des pays de la Communauté pour obtenir une matrice de parités pour ces pays uniquement. Ces parités ont été alors agrégées par la méthode Geary-Khamis de façon à correspondre à la structure moins détaillée des pays non-membres de la Communauté et raccordées aux parités des pays non-membres contenues dans la première matrice. On a ainsi obtenu une nouvelle matrice de parités pour les 22 pays qui, à la différence de la première, prenait en compte les données plus détaillées disponibles pour les pays de la Communauté.

La méthode Geary-Khamis a ensuite été utilisée deux fois pour mener l'agrégation jusqu'au bout ; elle a d'abord été appliquée aux parités des pays de la Communauté pour calculer les PPA et les valeurs réelles aux prix moyens de la CEE, puis aux parités des 22 pays pour obtenir les PPA et les valeurs réelles de la Communauté en tant que telle et celles des pays non-membres. Les niveaux du PIB de la Communauté en tant que telle, exprimé aux prix moyens de la CEE et exprimé aux prix moyens de l'OCDE étant différents, on a ajusté le premier de façon qu'il soit égal au second et appliqué ce facteur d'ajustement à la matrice de valeurs réelles des pays de la Communauté. Si les PIB des

linked through the respective totals at average EEC and average OECD prices for the Community as a whole.

In the calculation procedures just described, Austria was treated as a Community country because it had been invited to act as a "bridge country" between the Community and Poland, Hungary and Yugoslavia. Its PPPs and real values were therefore calculated at average EEC prices. Austria, however, is a non-Community country and in the tables its real values are shown at average OECD prices. These were obtained by linking and therefore are not additive.

The price data collected provided parities for all basic headings except those for Government Intermediate Consumption and Government Capital Consumption, Increase in Stocks, and Balance of Exports and Imports. Parities for Government Intermediate Consumption were derived using the parities for equivalent types of household expenditures. Similarly, for Government Capital Consumption, the parities for capital expenditures were used. For Increase in Stocks, special parities covering all goods, that is, both consumer goods and capital goods but not services, were calculated. Exchange rates were taken as the parities for the Balance of Exports and Imports.

UPDATING

The next benchmark year will be 1990. Until the new benchmark results are available, however, the 1985 PPPs for GDP will be updated annually and published in *National Accounts, Volume 1*. The PPPs will be updated by taking into account the relative rates of inflation in different countries as measured by the implicit price deflators for GDP. By the same means they will be also be backdated to 1970. The series will also cover Iceland and Switzerland; the PPPs for which will be estimated by regression methods.

raccordées de la même manière, au moyen de leurs valeurs pour la Communauté en tant que telle, respectivement aux prix moyens de la CEE et aux prix moyens de l'OCDE.

L'Autriche a été traitée comme un pays de la Communauté dans les calculs qui viennent d'être décrits. Elle a, en effet, servi de lien entre la Communauté d'une part, la Pologne, la Hongrie et la Yougoslavie d'autre part. Ses PPA et ses valeurs réelles ont donc été calculées aux prix moyens de la CEE. Elle est, cependant, un pays non-membre de la Communauté, et ses valeurs réelles sont exprimées aux prix moyens de l'OCDE dans les tableaux publiés. Ces valeurs réelles ont été obtenues par raccordement, la somme des composantes n'est donc pas égale au total.

Les données de prix collectées ont permis de calculer toutes les parités des rubriques élémentaires à l'exception de celles des postes suivants : Consommation intermédiaire et Consommation de capital des administrations publiques, Variations des stocks et Solde des exportations et des importations. Les parités de la consommation intermédiaire des administrations publiques ont été estimées à l'aide des parités de dépenses des ménages équivalentes. De même, des parités de consommation de capital ont été utilisées pour la consommation de capital des administrations publiques. Des parités spécifiques, prenant en compte tous les biens, c'est-à-dire à la fois les biens de consommation et les biens en capital, ont été calculées pour les variations des stocks. Enfin, les taux de change ont servi de parités pour le solde des exportations et des importations.

MISE A JOUR

1990 sera la prochaine année de référence. Cependant, en attendant que les nouveaux résultats soient disponibles, les PPA 1985 du PIB seront mises à jour à un rythme annuel et publiées dans le *Volume 1 des Comptes Nationaux*. La mise à jour pour les PPA sera faite en référence aux taux d'inflation relatifs des différents pays exprimés par les indices de prix implicites du PIB. Les séries de PPA seront extrapolées jusqu'en 1970 de la même manière. Enfin, les PPA pour l'Islande et la Suisse seront estimées à l'aide de régressions.

NOTES ON TABLES

The aggregates shown in the tables follow the ICP classification in Part One and the SNA classification in Part Two. In other words, government expenditures on health, education, social security and welfare services, and recreational and cultural services are classified under Individual Consumption of Households in Part One and under Government Final Consumption Expenditure in Part Two. The total transferred is identified in the SNA classification as *individual government services*. The ICP classification is not as explicit. Only expenditure on *public medical and health care*, that is, on both goods and services, is identified. The other expenditures are included with those by households under *recreational and cultural services, education, and other goods and services*.

Both Individual Consumption by Households and Private Final Consumption Expenditure include the expenditure of private non-profit institutions serving households.

Tables 1, 3, 6 and 11 show Community countries at average EEC prices; Tables 2, 4, 7 and 12 show non-Community countries at average OECD prices. The two sets of data coincide only at the level of GDP as a whole.

The PPPs and indices shown in Tables 5, 8, 9 and 10 are at international prices. They are fully comparable across all countries at each level of aggregation.

The components of Gross Fixed Capital Formation do not sum to the total. Gross Fixed Capital Formation includes expenditures on items other than construction and machinery and equipment, and this expenditure is not shown separately.

The ECU has been used as the national currency for *EEC-Total*.

The real values for Austria are not additive because they have been adjusted from average EEC prices to approximate average OECD prices.

Breakdowns of construction expenditure are not available for Australia and New Zealand.

Other than at the level of GDP, nominal values may differ from a country's own series because statistical discrepancies have been ratioed across all aggregates.

NOTES RELATIVES AUX TABLEAUX

Les agrégats publiés dans la Première Partie suivent la classification du PCI, ceux publiés dans la Deuxième Partie, celle du SCN. Autrement dit, les dépenses en matière de santé, enseignement, sécurité sociale et œuvres sociales, services de loisirs et culture sont comprises dans la Consommation individuelle des ménages pour la première partie et dans la Consommation finale des administrations publiques pour la deuxième partie. Dans le SCN, l'ensemble de ces dépenses figure sous la rubrique *Services individuels des administrations publiques*. La classification du PCI est moins explicite. Seules les dépenses publiques de santé, recouvrant les biens et les services, sont identifiées en tant que telles. Les autres dépenses publiques sont comprises avec les dépenses des ménages sous les rubriques *Services de loisirs et culture, Enseignement et Autres biens et services*.

La consommation des institutions privées sans but lucratif au service des ménages est comprise tant dans la Consommation individuelle des ménages que dans la Consommation finale privée.

Les données des tableaux 1, 3, 6 et 11, relatives aux pays de la Communauté, sont exprimées aux prix moyens de la CEE. Celles des tableaux 2, 4, 7 et 12, relatives aux pays non-membres de la Communauté, sont exprimées aux prix moyens de l'OCDE.

Les PPA et indices figurant dans les tableaux 5, 8, 9 et 10 sont exprimés aux prix internationaux. Ces données sont pleinement comparables pour tous les pays et ce, à tous les niveaux d'agrégation.

La somme des composantes de la Formation brute de capital fixe n'est pas égale au total. L'agrégat Formation brute de capital fixe recouvre d'autres dépenses en construction, machines et matériel d'équipement, mais qui ne figurent pas en tant que telles.

L'Ecu a été utilisé comme monnaie nationale pour le *total CEE*.

Les valeurs réelles pour l'Autriche ne sont pas additives car elles ont fait l'objet d'un ajustement pour passer des prix moyens de la CEE aux prix moyens de l'OCDE.

La ventilation des dépenses de construction n'est pas disponible pour l'Australie et la Nouvelle-Zélande.

Les valeurs nominales autres que celles du PIB peuvent ne pas être identiques aux données nationales car les divergences statistiques ont été réparties au prorata des composantes.

1985 results: ICP classification
